Avg kWh per measurement

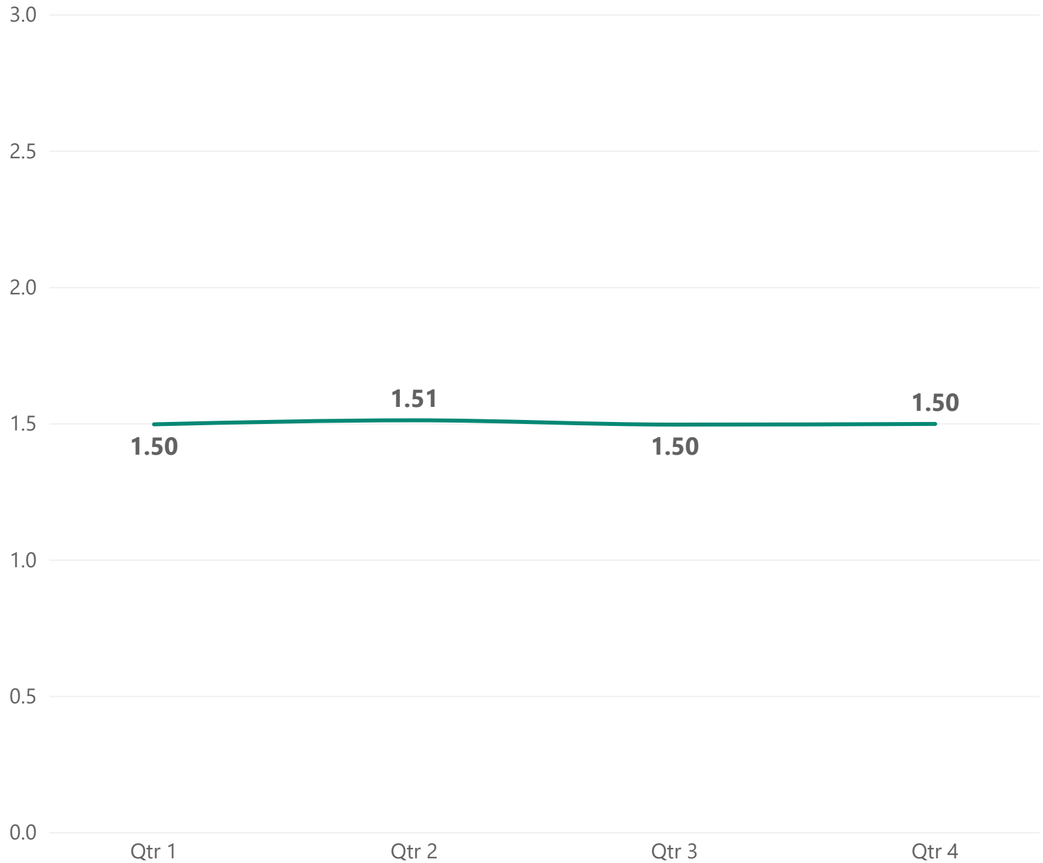

1.50

Average kWh per measurement by appliance

What is a measurement? One recorded energy value (kWh) for one appliance in one home. The data does not say how long each one covers.

Average kWh per measurement by quarter

The quarterly line is flat because this dataset shows no seasonal pattern. **See the "How to read this dashboard"**.

21% of homes

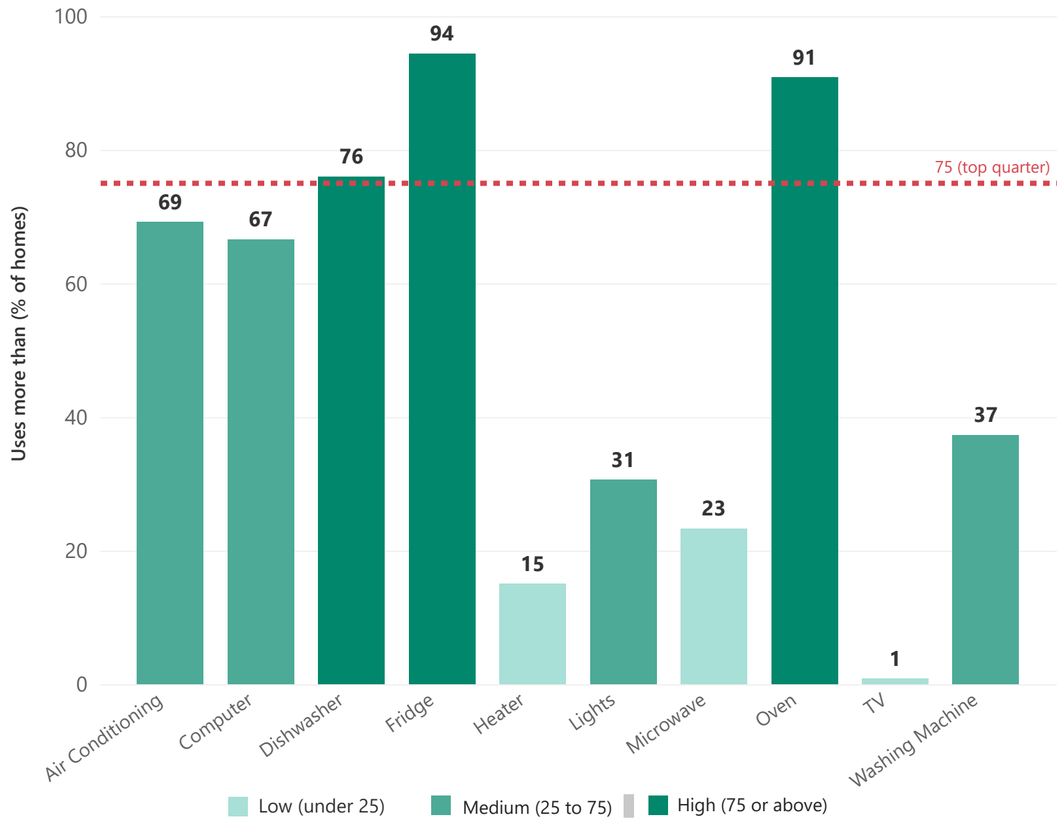

Difference from average home by appliance

0% = the average home. A bar above the dashed line (+20%) is worth a closer look

Energy use vs other homes by appliance

Each bar: how many of every 100 homes use less than this home

What is a measurement? One recorded energy value (kWh) for one appliance in one home. The data does not say how long each one covers.

Uses more than: for example, 80 means this home uses more energy than 80 of every 100 homes for that appliance. The dashed line at 75 marks the top quarter of homes. Differences between homes are small and may reflect random variation. **See "How to read this dashboard"**.

Average cost per measurement by appliance

Top 10 homes by average cost per measurement

Average cost of one measurement. Position only

What is a measurement? One recorded energy value (kWh) for one appliance in one home. The data does not say how long each one covers, so costs are for comparing, not a bill.

Cost = energy per measurement × 33 cents per kWh. Costs are per measurement, not per month or year: each home has only about 200 measurements, so a yearly bill cannot be estimated reliably. **See "How to read this dashboard"**.

How to read this dashboard

A short guide to the pages, terms and data used here

Pages

Overview
Energy use across all homes, by appliance and by quarter. Choose one or more homes on the left.

Household Profile
How one home compares with the other 500 homes, appliance by appliance. Choose one home.

Appliance Summary
The same comparison as a table, with a Low, Medium or High level for each appliance.

Cost
Energy use converted into dollars using a flat electricity rate. You can change the rate.

Using the slicer
Select homes (Overview, Cost): leave on "All" for all 500 homes, or pick one or more. Several homes show their average.
Select one home (Household Profile, Appliance Summary): pick one home. Both pages use the same choice.

Lines on the Household Profile
Dashed line at 75 (right chart): the top quarter of homes. A bar above it means this home uses more than 75 of every 100 homes for that appliance.

Dashed line at +20% (left chart): an appliance that uses more than 20% more energy than the average home.

An appliance above both lines is worth a site visit. Above only one: check again next quarter. Both lines are starting points to adjust with real data.

Terms

Measurement
One recorded energy value (kWh) for one appliance in one home. The data does not say how long each one covers.

kWh (kilowatt-hour)
The unit of energy shown on an electricity bill.

Avg kWh per measurement
The average energy of the measurements for the selected home(s) or appliance.

Uses more than (% of homes)
80 means this home uses more energy than 80% of the 500 homes for that appliance.

Level
Low: below 25. Medium: 25 to 75. High: 75 or above. Shows position only, not whether an appliance is efficient or wasteful.

Top quarter
The 25 of every 100 homes that use the most energy for an appliance (a position above 75)

Avg cost
The cost of the energy in one measurement, on average (avg kWh × electricity rate). For comparing, not a bill.

Difference vs all homes
How far the selected home(s) are above or below the average of all homes.

Top 10 homes
The ten selected homes with the highest average cost per measurement. It shows position only, not whether a home wastes energy.

Data and cost

About the data

• 500 homes, 10 appliance types and about 100,000 measurements, from 1 January 2023 to 1 January 2024.

• The data appears to be simulated: there is no seasonal pattern and homes are very similar to each other. Appliance type is the only clear difference.

• Rankings and levels show position only. They do not show unusual or wasteful use.

About the cost

• Cost = energy per measurement × a flat rate of about 33 c/kWh (AER Default Market Offer 2026-27, NSW Ausgrid single/flat rate, usage charge only, including GST), as at 30 Oct 2026.

• It is an indicative estimate, not a bill. The daily supply charge is not included.

• Costs are shown per measurement, not per month or year, because each home has only about 200 measurements, about 30 hours apart.
